

## Structural Engineers Association of Colorado Young Member Group

### Rocky Mountain Prestress Architectural Plant Tour

May 13, 2016  
Denver, CO

Nine members of the SEAC YMG toured the Rocky Mountain Prestress - Architectural Plant located in Denver. This tour is the first of a three part series of tours that will allow young members to observe the architectural precast concrete plant, structural precast concrete plant and the installation of precast concrete elements on a project. The tour of the architectural plant consisted of observing fabrication of the casting beds, layout of architectural features, layout of reinforcing and connections, placement of the concrete, and the washing and spot repair of the finished product. Not a lot of engineers design precast concrete elements, so this tour gave young members the opportunity to learn some of the process that is involved making a precast concrete design a reality. Rocky Mountain Prestress concluded the tour with a lunch for all who attended.
